**NOTICE:**

Recordings of the lecture are provided to students enrolled in the course for self-study only. Any other use, including reproduction and sharing of links to materials, is strictly prohibited.

## Preliminaries

---

- Reminders and Announcements
  - Midterm on Friday Feb 18, during class time, answer on Canvas using your laptop
  - Wednesday Feb 16 will be review, but to make the most of it, study lecture notes and textbook before that.
- Today
  - Assignment spotlights
  - Rendering 1 (need for Assignment 3)
  - Midterm format

## A1 spotlights

---

- For each assignment from now on, we will highlight a few creative efforts from students, to inspire us all
  - These are just meant to be examples... don't be discouraged if your's wasn't picked
- A1 spotlights

## Today: Modeling Material Appearance

---

- Rich variety of **materials**: characterized by surface reflectance and scattering

## Light blob from PVC plastic

---

- PVC blob
  - Note that this figure just describes the result of light that comes in from the specific shown direction  $\vec{l}$ . For other incoming directions we would need a different blob to visualize the resulting scattering.
  - The plastic will appear brightest when observed in the directions clustered about the 'bounce' direction of the light:

5

- 
- Switch to tablet

## Light blob from PVC plastic

- Given any vector  $\vec{w}$  (not necessarily of unit norm) and a unit normal vector  $\vec{n}$ , we can compute the bounce vector (mirror reflection) of  $\vec{w}$  as

$$B(\vec{w}) = 2(\vec{w} \cdot \vec{n})\vec{n} - \vec{w}$$

7

## About “in class” quizzes and midterm

Similar to Quiz 1, but potentially in-person only (checking with Associate Head).

- Duration 50 minutes, open book, open Internet (but no communication with any human about exam)
- During the class hour

## Midterm structure

---

- Exam is for 50 minutes, in class
- Budget 45 minutes for doing the quiz (One minute per mark)
- 4 Types of Question (Parts A,B,C,D)
  - Parts A-C: as in Quiz 1. 35 Marks
    - T/F questions. 1 mark each
    - “Recognition” Fill in the blanks (with multiple choice). 1 mark each (note: less than Quiz 1)
    - “Computing” Solve a small problem, and select the correct answer.
- Part D (10 marks). Solve a problem from a verbal description.
  - Either enter free-form answer or upload a file with answer for marking.

## Midterm Preparation

---

- **CAREFULLY** review ALL lectures before exam (including review lecture).
- Greater emphasis on topics covered after Quiz 1
  - Frames.
  - Chains of transformations
  - Types of transformations (TRS). Ch 2.4,2.5,2.6, and 3.4
  - Scene Graphs and Hierarchies. Ch 5.4.
    - Mainly focus on lecture notes (Three.js version)
  - Projection. Ch 10. Mainly focus on lecture notes
  - Depth. Ch 11.2 and 11.3 only. Skip 11.2.1
  - Rendering 1 (Ch 14)
  - Texturing 1 (Ch 15.1)

## Midterm Preparation

- Review material from Quiz 1 too!
- Review Assignments 1 and 2

11

## Example of Part D

You are given the task of animating a car driving on a road. The geometry of all the parts of the car, including the tires, is given in the “car frame,”  $\tilde{c} = \tilde{w} \tilde{C}$ .  $\tilde{w}$  is fixed to the world. Suppose  $\tilde{p}$  is a point on the tire, with coordinates  $\tilde{p}_c$  in frame  $\tilde{c}$ .

- (a) The car is moving to the right (in the  $\tilde{w}_y$  direction) with speed  $v$  m/s. What are the coordinates of  $\tilde{p}$  in the world frame after  $s$  seconds?

Answer: To move all points  $p_c$  on the car to the right we pre-multiply by a translation matrix  $M(s)$

$$\tilde{p}_w = M(s) \tilde{C} \tilde{p}_c$$

where

$$M(s) = \begin{pmatrix} 1 & . & . & . \\ . & 1 & . & vs \\ . & . & 1 & . \\ . & . & . & 1 \end{pmatrix}$$

- (b) In addition to the above, your boss wants you to make the tires rotate at  $r$  radians/s. Frame  $\tilde{t} = \tilde{c} \tilde{T}$  is located on the tire with its X-axis along the axis of rotation. Note that  $\tilde{t}$  is defined with respect to the car frame. What are the coordinates of  $\tilde{p}$  in the world frame after  $s$  seconds?

Answer: This is an example of “transforming about an auxiliary frame” that we looked at in Lecture 9. Now we need to rotate about the tire’s x axis (in addition to the rightward motion).

$$\tilde{p}_w = M(s) \tilde{C} \tilde{T} R(\theta) \tilde{T}^{-1} \tilde{p}_c$$

where the angle of rotation is  $\theta = rs$  and

$$R(\theta) = \begin{pmatrix} 1 & . & . & . \\ . & \cos \theta & -\sin \theta & . \\ . & \sin \theta & \cos \theta & . \\ . & . & . & 1 \end{pmatrix}$$

## Uploading answers to Part D

---

- Answer the questions by writing on a piece of paper or a tablet or by entering the answers (including math) in the text box
  - If you use the text box, matrices should be formatted, with LaTeX
  - If you are unable to use these methods, please contact me and the Centre of Accessibility as soon as possible for an accommodation to use another method
- Take a legible scan or image of the answer and upload to Canvas
  - Acceptable file types are pdf and jpg
  - PLEASE CHECK THAT YOU CAN DO THIS ASAP, and let me know if there is a reason why you are not able to do this during the exam

## Entering math in Canvas text boxes

---

Choose Math > Switch to Advanced

- 4X4 matrix template

```
\begin{pmatrix}
. & . & . & . \\
. & . & . & . \\
. & . & . & . \\
. & . & . & 1
\end{pmatrix}
```

- 3X3 matrix template

```
\begin{pmatrix}
. & . & . \\
. & . & . \\
. & . & 1
\end{pmatrix}
```

## Next Class

---

- Basic Texture mapping
